Dear Customer

We offer you the strongest magnets in many shapes and sizes. Nearly all of our magnets are made of Neodymium Iron Boron (NdFeB). These are the strongest permanent magnets in existence. They are many times stronger than typical magnets.

You have to experience these magnets yourself in order to understand why they are called "SuperMagnets".

This catalogue displays the same articles that are available in our webshop. You can find more detailed information and additional photos in the item descriptions at www.supermagnete.it. We have made every effort to simplify the order process for you.

We hope you enjoy your shopping experience!

Terms of Delivery (Italy)

Delivery Conditions of other countries: <http://www.supermagnete.it/eng/conditions.php?c=other>

Shipping Costs

The cost of shipping is EUR 9,00. (For custom-made orders or large quantities different shipping and handling charges may be negotiated.) The order will be sent in an insured package out of our distribution warehouse in Germany. The delivery in Italy is carried out by Poste Italiane / SDA or DHL.

VAT

All shop prices include Italian VAT of 20%. As a business outside of Germany, you will receive a tax free intracommunity delivery. In order to receive this, you must provide us with your tax-id number while placing your order.

Delivery time

Shipment typically occurs one business day after the order (respectively the payment) is received.

Delivery time after shipment is between 2 and 6 business days.

(Delivery time is determined by the German Post/DHL. They are guidance values and without obligation. supermagnete.it cannot accept responsibility for the timely arrival of your shipment.)

Payment

• Pre-payment to our bank account in Italy

We will send you our account details via e-mail with the order confirmation. As soon as we receive your payment, we will ship you the merchandise.

• Invoice

We will send you an invoice with the shipment. The net invoice amount is payable within 30 days without deductions. Only for public institutions (schools, museums, universities, ...), public authorities and well known companies. We reserve the right to request pre-payment from companies unknown to us or for very large orders.

• Credit card (Master Card, VISA, American Express)

Payment will be completed at the end of the order over a secure connection. Please note that your credit card company might charge an additional international service fee, as our registered offices are in Switzerland.

Minimum order

The minimum order amount is EUR 15,00 (not including shipping costs). For orders under EUR 15,00 we charge a **small quantity surcharge** of EUR 7,00 (or the difference to the minimum order value) to cover the packaging costs.

Countersunk Rings:

This neodymium ring magnet in a steel pot is countersunk. It can be fastened with a countersunk screw. The steel pot substantially increases the holding power of the magnet, but requires full contact with the opposing part, e.g. a steel plate. Magnets in steel pots don't have much effect into the distance, i.e. they are not suitable to attract a metal item from a distance, but they are very well suited to hold on to a piece of metal in full contact.

Magnetic Hooks:

These magnetic hooks have, thanks to the use of SuperMagnets, unbelievably small dimensions in comparison to their magnetic strength. Due to the fact that they are embedded in a steel pot, they are stronger than the same-size "naked" neodymium magnets.

The indicated holding strength corresponds to an optimal surface, i.e. a thick, smooth sanded steel. Note that the strength of the magnet distinctly reduces if the metal is thinner, painted, or does not possess a smooth surface.

The holding strength has been measured to be perpendicular to the supporting surface. As such, it takes much less strength to move the magnets sideways. For example, a hook that is attached to the ceiling and can hold 5 kg can only hold approximately 1 kg without slipping when attached to the wall.

Questions About Our Webshop

Do you deliver on account?

We deliver on account to

- public institutions (schools, museums, universities, ...)
- authorities
- well known companies

We reserve the right to request pre-payment from companies unknown to us or for very large orders. (See our terms of delivery [<http://www.supermagnete.it/eng/conditions.php>]).

Do you deliver COD (cash on delivery)?

Due to the high costs involved in COD, we do not offer this method of payment at present.

Can I buy super magnets in stores?

No, we do not maintain any shops. We distribute our magnets exclusively through our webshop.

Can I pick up my super magnets myself?

We have only a few magnet samples in our offices in Uster and our warehouse is managed by an external logistics company. Therefore, it is not possible for you to personally pick up your order.

Your company is in Switzerland and I live in Italy - isn't that problematic?

No, not at all!

- **Delivery duty paid:** It is correct that our head office and our magnet storage are located in Switzerland. However, we deliver all orders to Germany daily by courier, so all packages are already duty and tax paid in the EU by the time we send them to Italy.
- **Italian law:** Our prices already include the Italian value-added tax. If you are a private customer, the Italian Consumer Law (codice del consumo) with the 10-day right of withdrawal [<http://www.supermagnete.it/eng/agb.php#p9>] applies. For returns we have an address in Germany.
- **Bank account in Italy:** You can make your payment directly to our bank in Italy.

In a nutshell: We arranged everything for you to have an uncomplicated order experience.

Questions About Our Assortment

I can't find my desired size of magnet in your webshop. Do you deliver custom made magnets?

Yes, we would be pleased to send you an offer for a custom made magnet. Simply enter the desired specifications in the request form [http://www.supermagnete.it/eng/custom_form.php].

Please note: Custom orders must be paid in advance and, after payment is received, the delivery time will be approx. 4-8 weeks.

In which direction are the magnets magnetised? Where are the poles?

Practically all of our magnets are magnetised **parallel to the shortest side**. There are a few exceptions (e.g., Q-19-13-06-LN) which are specially described in the article descriptions.

This means: For **blocks**, the poles are normally on the largest surface areas.

For **rods** and **discs**, the poles are on the circular surface area. This is also called "axial" magnetisation.

The **rings** are - unless otherwise noted - also axially magnetised.

The poles lie on 2 opposite surface areas of the **cubes**.

Likewise, the **spheres** have 2 opposite poles, much like the globe.

Could you advise me on my magnet application?

Possibly - try us! We can probably help you with certain questions. It's best if you contact us via e-mail with a description of your planned use of the magnets. Our strengths definitely lie in the procurement, sales and distribution of low-priced neodymium magnets and efficient logistics, and less in the development of magnet systems. If we are not sure that we can handle your question with the required amount of competence, we will certainly let you know.

Questions about neodymium super magnets

What do the specifications N40, N42, N45, etc. mean?

The specifications N40, N42, N45, N45H etc. is a measurement for the quality of the magnet material. You can read two things from this:

- How much **"magnet energy"** per volume is contained in this magnetic material
- Up to what **temperature** the magnet can be used

The **numbers** (e.g., 40, 42, 45) are equivalent to approximately the maximum energy product [http://www.supermagnete.it/eng/faq/energy_product] of the magnet (in MGOe).

The **letters** N, M, H and respectively the letters SH, EH or UH say something about the maximum working temperature, which can be 80, 100, 120, 150, 180 or 200 °C. Most of our magnets begin with an "N" and should be used at 80 °C.

When we speak colloquially about the **"power"** of a magnet, we usually mean either the holding strength by direct contact with a metal plate or the attractive force to a piece of iron (or another magnet) at a certain range.

For this "power", the applied magnet material is not decisive in and of itself, but equally important is the **volume** of the magnet, the **form** of the magnet, the **proportions** of the magnet (e.g., the ratio between the diameter and the thickness of a disc magnet) and the **combination with other materials**, so e.g., the magnet is mounted on a piece of metal, in a metal pot, or is "free-standing".

This is similarly true in relationship to working temperature. The specified maximum temperature can only be used without a problem when the aspect ratio of the magnet is "optimal". If a magnet is, for example, too thin in relation to its diameter (or side length), the maximum temperature is reached earlier.

If you take any two magnets of differing size and magnetisation from our collection, the difference in their strength is more due to the differences in their volume than the differences in their magnetisation. For this reason, the larger magnet is the stronger magnet, even when its magnetisation classification is somewhat smaller.

You can find the exact associations between these classifications and the physical values of a magnet in the table Physical magnet data [http://www.supermagnete.it/eng/data_table.php].

How strong are these magnets?

In the description of a few of our magnets, we indicate an approximate holding strength in grams or kilograms. Please note that this refers to a theoretically-attainable, maximum value that only applies under optimal conditions. The actual holding strength is dependent upon the following factors:

- **Distance between the magnet and the object it is attracted to:**

If there is no direct contact, the holding strength reduces very quickly with increasing distance. Even a half millimetre air gap can possibly reduce the holding strength by half. Even a thin coat of paint on a metallic object can cause a reduction in holding strength of the magnet.

- **Material of the object of magnetic attraction:**

The theoretical holding strength is valid when the object of magnetic attraction consists of soft iron. This value reduces by 5% with structural steel ST37; with ST70 by approx. 30%.

- **Surface area of the object of magnetic attraction:**

The smoother the surface, the greater the holding strength. For rougher surfaces, you should anticipate a considerable reduction in holding strength.

- **Direction of the force:**

The theoretical holding strength is valid if a vertical force applies, that is, if the object of magnetic attraction is pulled vertically by the magnet.

- **Thickness of the object of magnetic attraction:**

The object should not be too thin or a magnetic saturation will be achieved and part of the magnetic field will remain useless.

In principle, when planning a specific application of the magnets, you should not rely upon our holding strength specifications, but instead experiment first a bit of your own.

Incidentally: If you require the holding force in Newton, multiply our specifications in kg by 9,81 (a mass of 1 kg creates a downward force of 9,81 Newton).

Where are super magnets manufactured?

Our magnets are produced in China. About 140 Chinese manufacturers produce approximately 60% of all neodymium magnets worldwide. We evaluated at least a dozen different manufacturers and checked the price/benefit-relationship. Our current supplier delivers magnets of constant quality at very reasonable prices. And since we purchase magnets in large amounts and have automated nearly 100% of the order process, we are fairly certain that, with us, you will find the very best price/benefit-relationship.

What kind of adhesives can I use for magnets?

We recommend **UHU plus endfest 300** for most applications. Therefore, we offer this article in our online shop. You can find additional information under article description [<http://www.supermagnete.it/eng/M-15>].

Do magnets weaken over time?

Under normal conditions, neodymium magnets retain their magnetism nearly indefinitely. They differ in this case from conventional ferrite magnets that lose their magnetism over time, even without outside influences.

Influences that can lead to a loss of magnetic strength in neodymium magnets include:

- heat: most of our magnets should be exposed to a maximum of 80° C
- other strong magnetic fields

Customer Testimonials

Thanks for the magnets. Thanks especially for the extra magnets. When I was opening the package, first I was detaching S-20-10-N discs from their own package and immediately I got 2 of those magnets stuck to together and I had hard time detaching them. Later i detached those with a flat knife.

K.H.H.

Yesterday evening my flat mate got to know the "skin pincher" [Q-20-20-10-N] a bit closer. He yelped like a puppy dog.

M.S.

I am so surprised that an Internet order can be executed so painlessly and so fast these days that I just felt I needed to tell you. I wish you many more happy customers.

F.K.

The magnets are unbelievable, and of course I have already pinched my fingers (not for the first time ...)

H.P.

You guys are crazy! I haven't seen anything like that before.

S.L.

Having read the part of your warnings where it says "Don't say you haven't been warned" I let two Q-25-25-13 clash together yesterday while holding my finger between them. One would not believe how much that hurts!!

J.S.
